API Access Request — Email Drafts

Solar monitoring platform integrations · TSBA AI Agent · Prepared 2026-11-06

Two providers require a support request to unlock API access. The drafts below are ready to send — replace the **highlighted placeholders** and send each **from the account's registered email address** so support can verify ownership. SolisCloud and Elekeeper are self-service and need no email (summarised at the bottom).

3 WHEC Echo-Hub

OpenAPI enablement Support request

Email draft

To	WHEC Echo-Hub Support <[support email]>
From	[Registered Account Email]
Subject	Request to Enable OpenAPI Access on Our Account

```
Dear WHEC Echo-Hub Support Team,

We would like to request that OpenAPI access be enabled on our account.

Account details:
  - Account name / ID: [Account Name / ID]
  - Registered email: [Registered Account Email]
  - Company: [Company Name]

We intend to use the OpenAPI to integrate our plant and device
monitoring data
into our internal energy-management platform.

Please let us know if any additional verification or documentation is
required
to proceed. We look forward to receiving the API credentials and
documentation.

Thank you for your assistance.

Best regards,
[Your Name]
[Company Name]
[Contact Phone]
```

Send from the registered email. Identity is verified against the account's registered address — sending from any other mailbox will likely delay or reject the request.

4 Solarman

Developer / OpenAPI activation Support request

Email draft

To	Solarman Support <[support email]>
From	[Registered Account Email]
Subject	Request to Activate Developer / OpenAPI Access

Dear Solarman Support Team,

We would like to request activation of the **Developer option / OpenAPI access**
for our account.

Account details:
- Account name / ID: **[Account Name / ID]**
- Registered email: **[Registered Account Email]**
- Company: **[Company Name]**

We plan to integrate our plant monitoring data (production, device status, and
historical generation) into our internal platform via the OpenAPI.

Please advise on any additional steps, agreements, or verification needed to
enable developer access, and provide the App ID / App Secret and API documentation once activated.

Thank you for your support.

Best regards,
[Your Name]
[Company Name]
[Contact Phone]

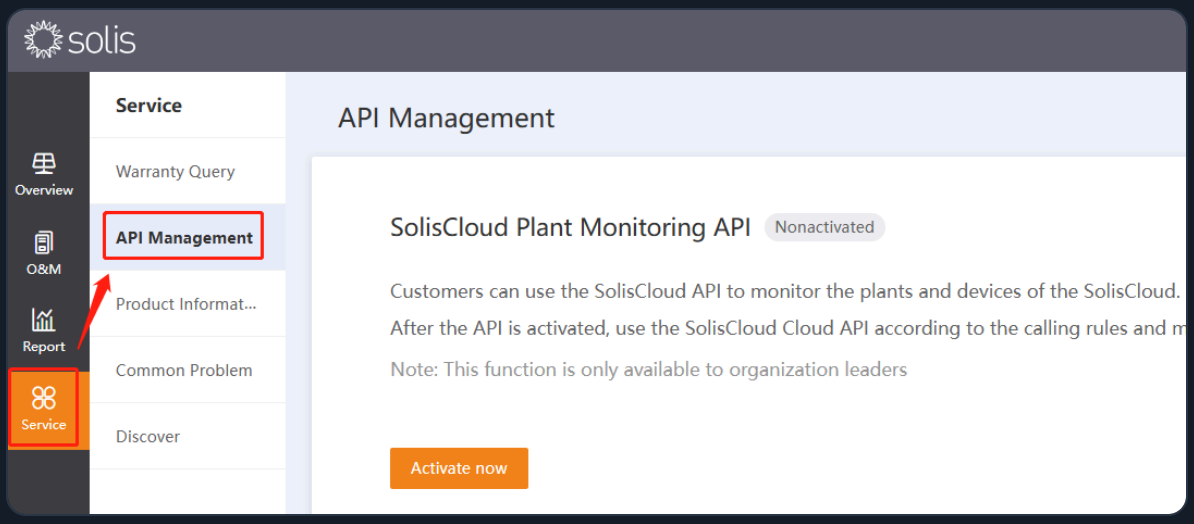

> **Send from the registered email.** Solarman activates developer/OpenAPI access manually after verifying account ownership from the registered address.

Self-service platforms (no email required)

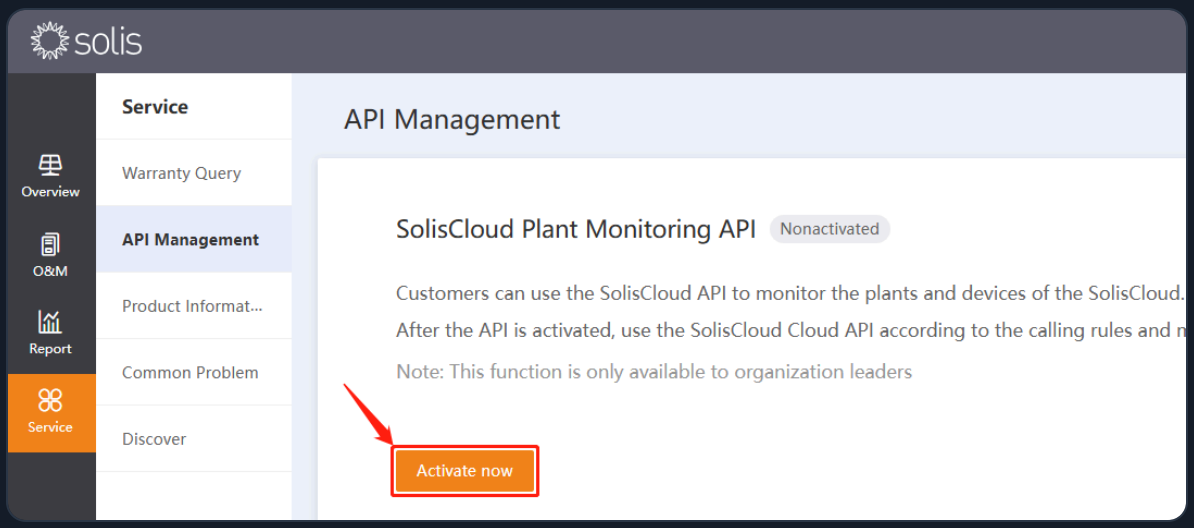

1 · SolisCloud

Only available to organization leaders (owner / administrator account).

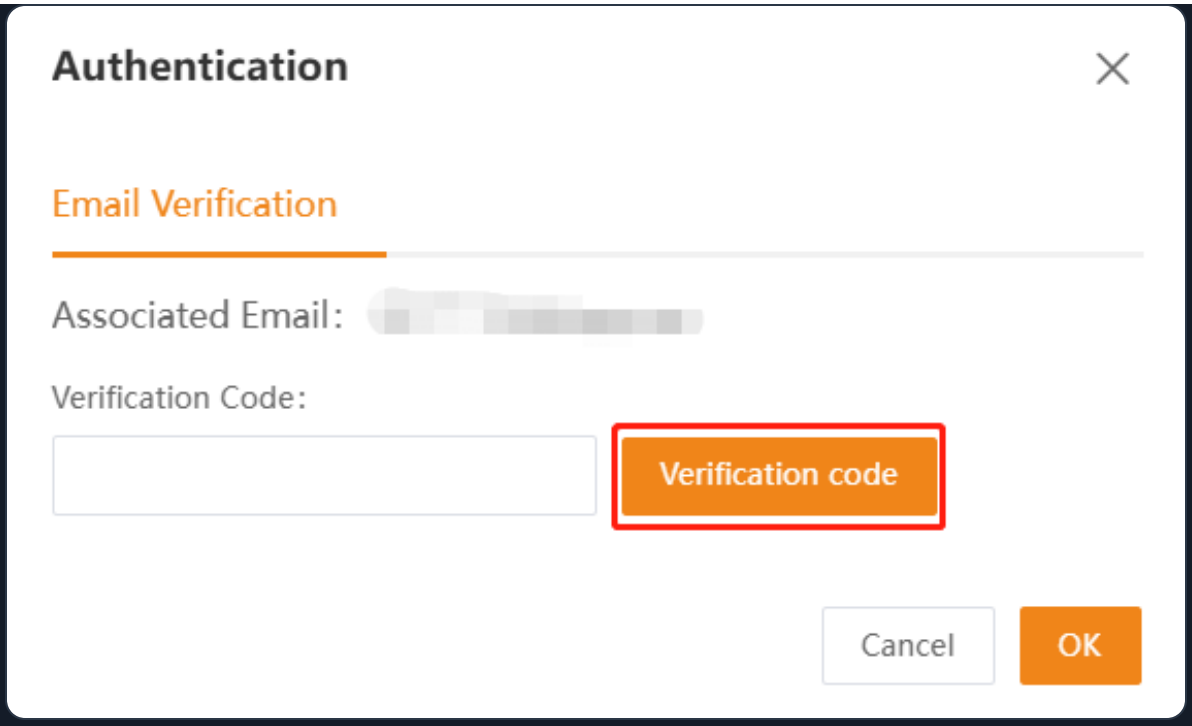

1. Log in with the owner/administrator account. In the left sidebar open `Service`, then select `API Management`.
2. On the **SolisCloud Plant Monitoring API** panel (status: *Nonactivated*), click `Activate now`.
3. Complete **Email Verification**: click `Verification code`, enter the code sent to the associated email, then click `OK`.
4. The status changes to *Activated*. Click `View Key` to open the credentials.
5. Copy the **KeyID**, **KeySecret**, and **API URL** — these are used to authenticate against the SolisCloud API.

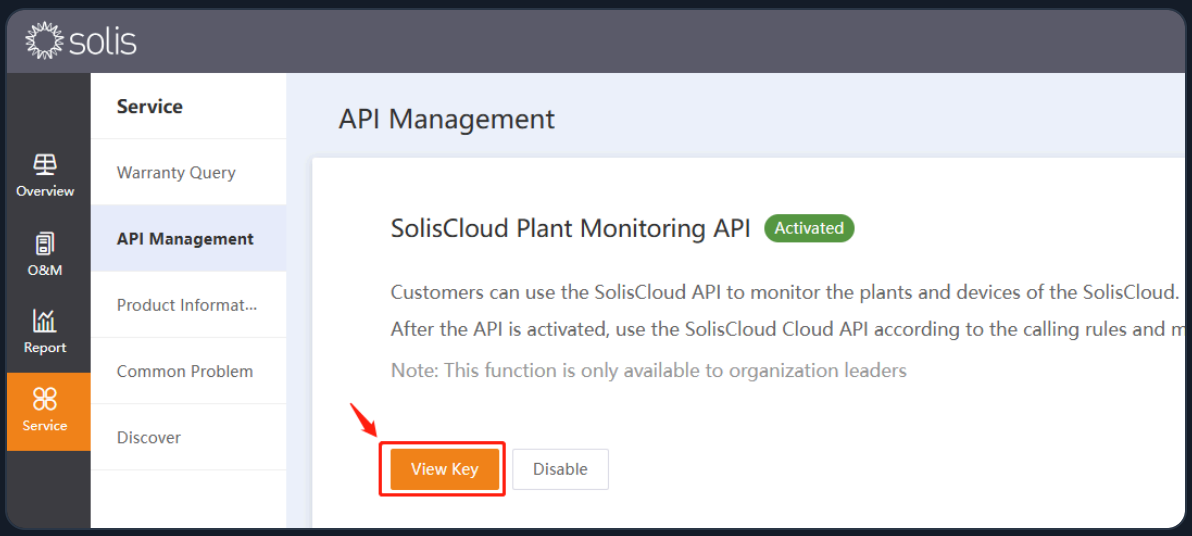

*Step 1 — **Service → API Management**.*

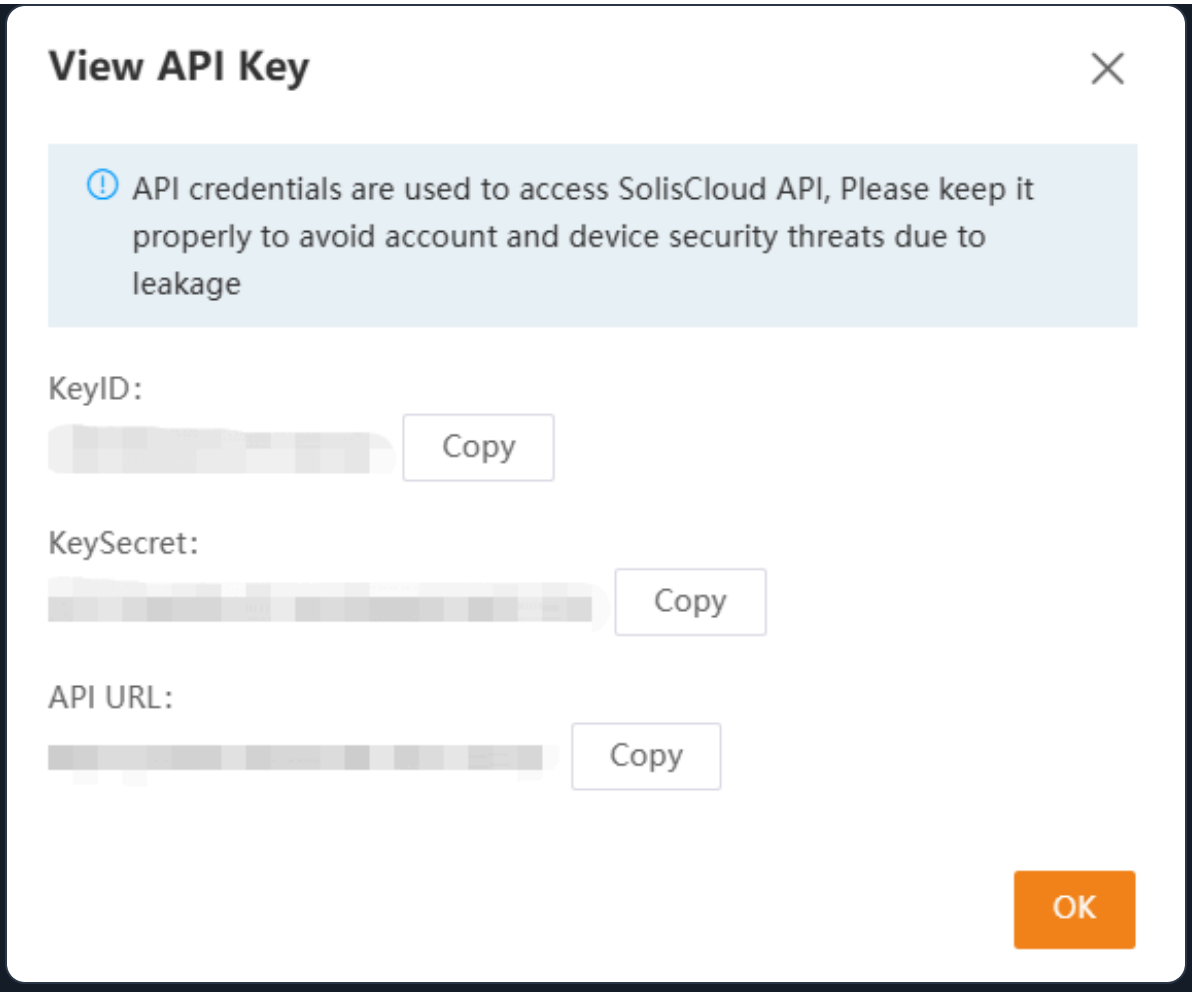

*Step 2 — Click **Activate now**.*

Step 3 — Email verification: request the code and confirm.

*Step 4 — Status **Activated**; click **View Key**.*

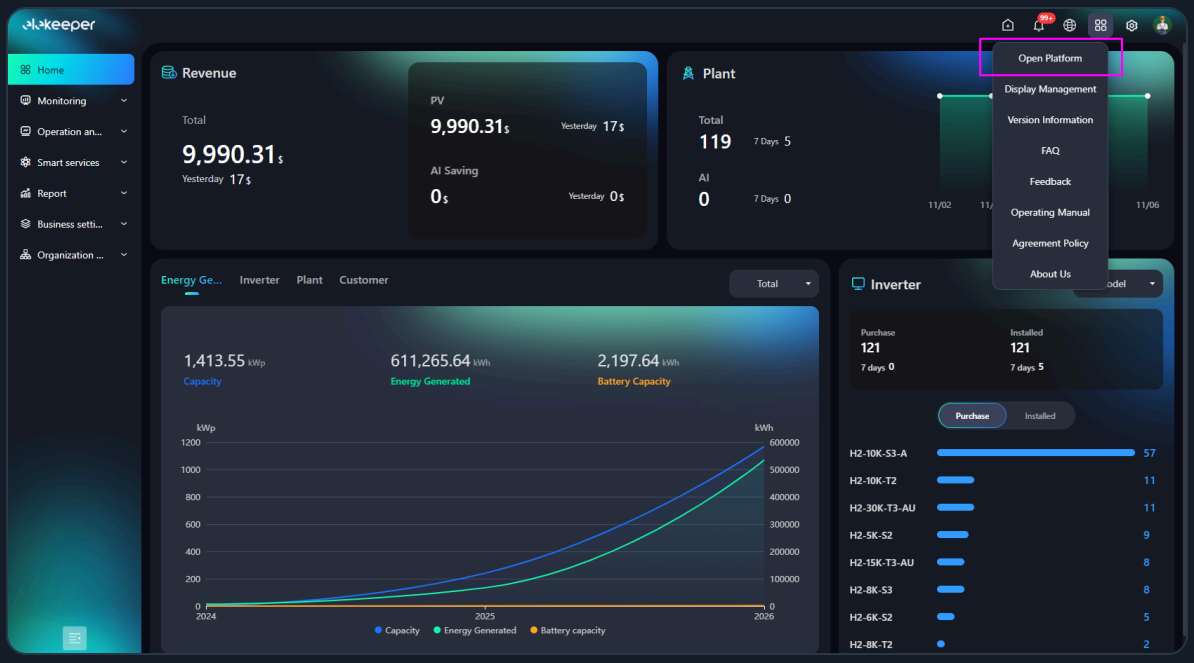

*Step 5 — Copy **KeyID**, **KeySecret** and **API URL**.*

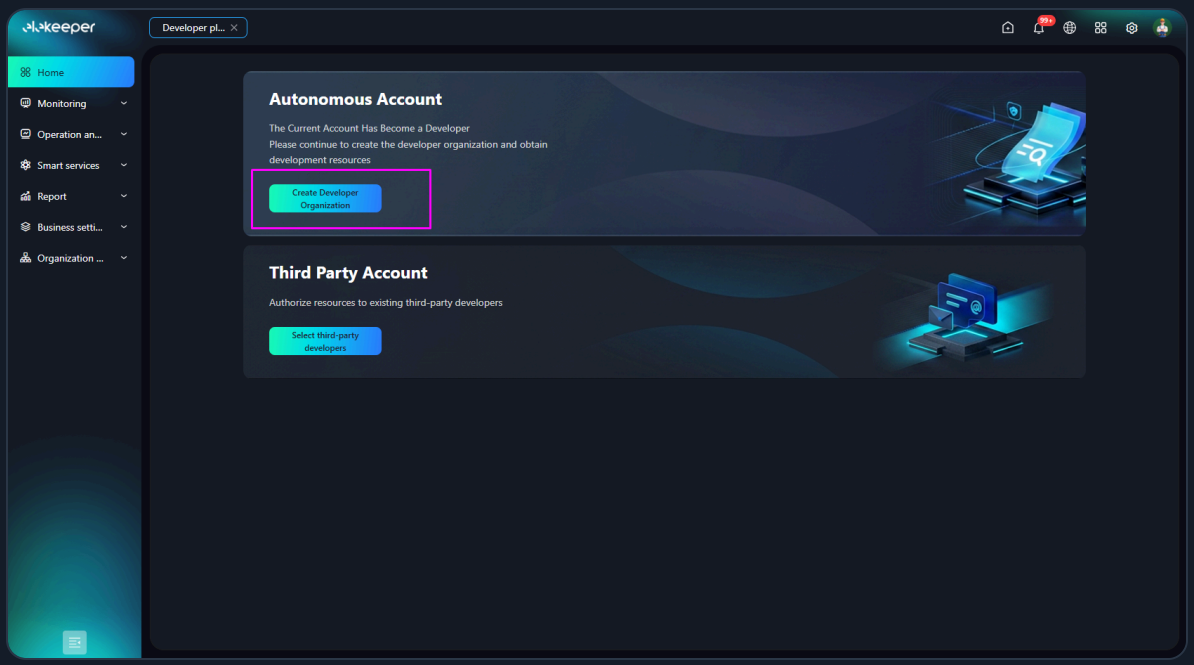

> **Keep these credentials secret.** Store the KeyID / KeySecret in `.env` or a secrets manager — never commit them to version control.

2 · Elekeeper (SAJ)

1. Log in to the Elekeeper portal.
2. In the **top-right toolbar**, click the **apps / grid icon** (⊞) and select `Open Platform` from the dropdown.
3. On the **Developer Platform** page, under *Autonomous Account*, click `Create Developer Organization` and complete the setup to obtain development resources (API credentials).
   Use Third-Party Account → Select third-party developers only to authorize an existing external developer.

*Step 2 — Apps menu (top-right): select **Open Platform**.*

*Step 3 — Developer Platform: click **Create Developer Organization**.*

Generated for the TSBA AI Agent solar monitoring integration. Keep account IDs and issued API secrets out of version control — store them in `.env` / a secrets manager.
